

EUDR Deforestation Risk Assessment
Kodagu District, Karnataka, India
Analysis Period: Feb 2021 – Feb 2025

NDVI Change 2021-2025

FINDINGS

Area assessed: ~19 x 15 km, Kodagu District, Karnataka
Imagery: Sentinel-2 L2A, 10 m resolution
Dates compared: 20 Feb 2021 vs 19 Feb 2025 (dry season)
Method: NDVI difference, water-masked

RESULT: No evidence of large-scale forest clearing detected.
Vegetation cover remained stable (NDVI 0.7-0.85) across the majority of the assessed area.

One high-magnitude signal (NDVI -0.35) was investigated and excluded: spectral analysis showed increased NIR and Red reflectance, consistent with reservoir water-level change and exposed sediment, not vegetation removal.

LIMITATIONS

- Steep terrain causes illumination differences between dates; no topographic correction applied.
- Shade-grown coffee expansion under existing canopy may not be detectable by NDVI alone.
- This is a risk screening, not a legal certification.

Data source: Contains modified Copernicus Sentinel data (2021, 2025), processed by Rohan Kumar
